## IN THE CLAIMS:

Please cancel Claims 12-17 without prejudice to or disclaimer of the subject matter contained therein.

Please amend Claims 1, 7 and 9 as follows.

1. (Currently Amended) A recording medium comprising:

a <u>paper</u> substrate having two surfaces, on both of which are provided an ink receiving layer containing an inorganic pigment and an outermost surface layer <del>primarily</del> comprising consisting of thermoplastic latex resin, in this order,

wherein the outermost latex surface layer forms a transparent film upon heating of the recording medium.

- 2. (Original) A recording medium according to Claim 1, wherein the inorganic pigment comprises alumina hydrate.
- 3. (Previously Presented) A recording medium according to Claim 1, wherein the difference in the amount of coating between said ink receiving layers on the two surfaces of the substrate is equal to or less than  $15 \text{ g/m}^2$ .
  - 4. (Withdrawn) A recording method comprising the steps of:

performing ink-jet recording on the recording medium according to Claim 1; and heating the recording medium after the ink-jet recording.

- 5. (Withdrawn) A recording method according to Claim 4, wherein recording is performed on both surfaces of the recording medium.
- 6. (Previously Presented) A recording medium according to Claim 1, wherein the latex resin is vinyl chloride-vinyl acetate latex resin.
  - 7. (Currently Amended) A print obtained by a process comprising the steps of:
  - (i) providing a recording medium according to Claim 1;
  - (ii) applying an ink to the recording medium by an ink-jet recording system;
- (iii) heating both of the outermost latex <u>surfaces</u> layers of the recording medium resulting from step (ii) so that the outermost latex surface layers form transparent films.
- 8. (Withdrawn) A print according to Claim 7, wherein pressure is applied to the recording medium at the same time as heating in step (iii).
  - 9. (Currently Amended) A print comprising:

a substrate having two surfaces, on both of which are provided an ink receiving layer containing an inorganic pigment and a layer primarily comprising consisting of latex resin, in this order,

wherein an image is formed on at least one of the ink receiving layers, and wherein the layer comprising consisting of latex resin forms a transparent film upon heating of said print.

- 10. (Withdrawn) A curl-controlling method comprising the steps of:
- (i) providing the recording medium according to claim 1,
- (ii) heating both of the outermost latex surface layers of the recording medium to provide transparent films.
- 11. (Withdrawn) A curl-controlling method according to claim 10, wherein pressure is applied to the recording medium at the same time as heating in step (ii).

12-17. (Cancelled)
